Hinglish Editor DEV — Laptop Steps

Smart Visuals (web agent + evaluator) and Sound Design v4 · 26 Sep 2026 · branch **claude/exciting-mendel-isrgzw**

Important: everything happens in **E:\Hinglish Editor DEV**. Never touch **E:\remove silence** (your original app). Follow the steps in order; each takes a few minutes. Nothing here was tested with real internet, real AI models or real Premiere/Resolve yet: this laptop run is the first real test, so please send me what you see (Part F).

What you will get

Feature	What it does
Smart Visuals (new, button 5)	The AI reads your speech, finds the real person / app logo / place / event you talk about, searches the whole internet (Google-style image search, YouTube and 1000+ video sites, Wikipedia) and puts real photos, logos (PNG) and footage on your timeline. Logos and faces pop up on the word; stories, places and facts go full screen.
Evaluator (inside Smart Visuals)	A vision AI (qwen2.5vl) looks at every picture/video before it is used: is it really a temple (not a dog)? Really Meenakshi temple (not a random one)? Does the logo really read "Zomato"? No watermark? Wrong files are thrown out.
Sound Design v4	The AI now HEARS your sound library (CLAP), needs a reason in your words for every sound, follows the tone of each line, uses fewer and better sounds, never uses songs with singing under your voice, checks the mix, and learns your taste when you untick sounds and click Save & remix.

Part A — Get the new code (once)

1 Open PowerShell in the DEV folder

- Open File Explorer and go to **E:\Hinglish Editor DEV**.
- Click the address bar, type **powershell**, press Enter. A blue window opens in that folder.

2 Check that nothing is half-changed

```
git status
```

It should say **nothing to commit, working tree clean** (files like config.broll.local.json, output, cache are ignored and are fine).

If it lists changed files, **stop** and send me a screenshot. Do not delete anything.

3 Download the new branch and switch to it

```
git fetch origin
git checkout claude/exciting-mendel-isrgzw
git pull
```

The last line should say it is up to date. Check the latest change:

```
git log --oneline -1
```

You should see **6ca66b0 Sound Design v4: keep original Windows line endings…** (or newer).

> If git says **"origin" does not appear to be a git repository**, run this once, then repeat step 3:
> `git remote add origin https://github.com/Vineetkumar19/hinglish-editor-dev.git`

4 Install the new Python packages

```
.venv\Scripts\python.exe -m pip install -r requirements.txt
```

This adds: **ddgs** (web image/video search), **yt-dlp** (video download), **imageio-ffmpeg** (video joining), **requests**, **regex**. Your torch / CUDA setup is not touched.

Check it worked (should print three version numbers):

```
.venv\Scripts\python.exe -c "import ddgs, yt_dlp, imageio_ffmpeg; print(ddgs.__version__,
yt_dlp.version.__version__, imageio_ffmpeg.__version__)"
```

5 Check the Ollama models

Open the **Ollama** app (it must stay running). Then in PowerShell:

```
ollama list
```

You need these three. Pull any that are missing (each is a big download, one time only):

Model	Used for	Command if missing
qwen3:8b	the thinking brain (Visuals + Sound)	`ollama pull qwen3:8b`
qwen2.5vl:7b	the Evaluator (looks at pictures)	`ollama pull qwen2.5vl:7b`
qwen3-embedding:0.6b	sound library search	`ollama pull qwen3-embedding:0.6b`

6 Check disk space on E:

E: had only ~14 GB free. The first runs add: the sound listening model (~0.8 GB, into models\) and downloaded web pictures/video parts (into cache\visuals). Keep at least **5 GB free**.

> Safe to delete any time to free space (they rebuild): **cache\visuals\web-video** and **cache\visuals\media**.

Part B — Test Smart Visuals

7 Start the app

Double-click **Run Hinglish Editor.bat** in E:\Hinglish Editor DEV. The page opens at **http://127.0.0.1:8766** (the DEV port). Keep the black window open while working.

8 Pick a good test video

Best test: a video where you **name a famous person** (e.g. Gandhi ji), **an app** (Zomato, Swiggy) and **a place** (Meenakshi temple). You can also use **input\final-demo\madurai_1.mp4**, or a timeline XML from Smart Clean / Script Edit.

9 Run it

- Click **Smart Visuals** (button 5) on the left.
- **Choose videos** (or **Or choose a timeline XML…**).
- Leave the options as they are: How many visuals = **Medium**, AI brain = **Auto**, Pop-up logo/face = **on**, Search the whole web = **on**, Evaluator = **on**.
- Click the orange **Add smart visuals** button.
- Open **Activity** under the progress bar to watch what the agent is doing ("Searching the internet…", "Evaluator PASS/FAIL…").

> On the current CPU laptop this is **slow** (thinking + searching + checking every picture). Let it finish. On the RTX 5070 Ti it will be much faster.

10 Check the result page

When it says **Your timeline is ready**, click **Review result**. Check each visual:

Check	Good sign
Right person / brand / place?	Real Gandhi photo/footage, real Zomato logo, real Meenakshi temple
Green "Evaluator PASS" box	It says what it saw, e.g. "red logo with white text zomato"
"Rejected" lines	Wrong files that were thrown out, with the reason
Timing	Logo pops exactly when you say the name; full-screen visual only while that line is spoken
Pop-up position	Never covers your face
preview.mp4	Plays with your voice

Don’t like one? Click another thumbnail or **No visual**, then **Save & rebuild**.

11 Credits (before posting)

Open **CREDITS.txt** in the result folder (**Open folder** button). Paste it into your video description. Web and YouTube files can be copyrighted: check any clip you are unsure about.

12 Import into Premiere Pro or DaVinci Resolve

- **Premiere Pro:** File > Import > choose **VISUALS_SEQUENCE.xml** from the result folder. Open the new sequence **<name>_VISUALS**: V1 = your edit, V2 = full-screen visuals, V3 = pop-ups (transparent).
- **DaVinci Resolve Studio:** keep Resolve open and click **Import to Resolve** on the app's result card, or in Resolve: File > Import > Timeline > choose VISUALS_SEQUENCE.xml.
- Check that V2/V3 line up with your words and that the pop-ups are transparent (not black boxes).

> The Premiere/Resolve **panels** installed on this PC still point to your original app, which does not have the new buttons. Importing the XML (above) is enough for testing. Only if you want the buttons inside Premiere/Resolve: run **Install Editor Plugins.bat** from the **DEV** folder. To switch back later, run it again from **E:\remove silence**.

Part C — Test Sound Design v4

13 Run Sound Design

- Keep the Ollama app running.
- In the app click **Sound Design** (button 7), choose a video or your finished timeline XML (for example the VISUALS or ZOOM XML), leave Style = **Auto**, How many effects = **Medium**.
- Click **Design the sound**.

> **First run only:** it downloads the listening model (~0.8 GB, needs internet) and listens to your whole library once (about 1,400 files). This takes a while. It is saved, so later runs are faster.

14 Listen and check the result page

Look at	What it means
Sounds table	Each sound shows its **trigger** (punchline, list item, app name…), the word, the tone of the line, and the evaluator: what it heard
Skipped by the rules	Sounds the AI wanted but the rules blocked (no reason in the words, or a playful sound on a sad line)
Music	Instrumental only; singing tracks are thrown out
Mix check	Effect levels, music under your voice, loudness, clipping, number of sounds

15 Teach it your taste (most important)

- **Untick** every sound you don’t like (and untick Music if needed).
- Click **Save & remix**. The preview and SOUND_SEQUENCE.xml are rebuilt.
- It remembers: a sound you remove twice is never used again, and your choices become examples the AI follows next time.
- Do this on **5–10 videos**: it gets closer to your style each time.

> To reset what it learned: delete **cache\learning\sound-preferences.json**.

16 Import the sound

Premiere: File > Import > **SOUND_SEQUENCE.xml** (music and each effect on their own tracks, levels already set). Resolve: Import to Resolve button or File > Import > Timeline.

Part D — Optional checks

17 Re-check a finished Smart Visuals result

Replace the folder names with yours (copy the path from the result folder):

```
.venv\Scripts\python.exe -m hinglish_visuals.evaluator --project
  "output\visuals\<date>\001-<video>\visuals-project.json"
```

It prints PASS / FAIL for every visual and saves EVALUATION.json.

18 Pending from before

- **Pexels key:** Add B-roll > B-roll settings > paste the key again with the copy button (the old one was rejected). Type keys only in the app, never in chat.
- **RTX 5070 Ti laptop** (when it arrives): Setup RTX 5070.bat, install Ollama + the three models, then Setup Eye Contact (RTX).bat for Eye Contact.

Part E — If something goes wrong

Problem	What to do
“The local engine is not running” / Failed to fetch	Double-click Run Hinglish Editor.bat in the DEV folder, press F5 on the page, run again.
“Ollama is not running” or “missing qwen…”	Open the Ollama app; run the ollama pull command from step 5.
pip install errors in step 4	Send me a screenshot of the red text. Do not reinstall torch.
Smart Visuals: “Web image search skipped”	Search sites sometimes limit requests. Wait 10 minutes and run again (results are cached).
Wikimedia / Commons says 403	Tell me: one-line fix in hinglish_visuals\web.py (USER_AGENT).
YouTube downloads stop working	`.venv\Scripts\python.exe -m pip install -U yt-dlp`
Evaluator shows “NOT CHECKED”	Ollama is not running or qwen2.5vl:7b is missing (step 5).
Sound: “Listening model unavailable”	Needs internet on the first run to download it; run again when online.
Pop-ups are black boxes in the editor	Tell me which editor and version (the .mov files have transparency).
Disk full	Delete cache\visuals\web-video and cache\visuals\media (step 6).

Part F — Send me this after testing

- Screenshots of the **Smart Visuals** result page and the **Sound Design** result page.
- The text from **Activity** (click it, select all, copy, paste to me).
- The **EVALUATION.json** file from the Smart Visuals result folder.
- What looked wrong (which second, which picture or sound).
- When you are happy, tell me **“merge to main”**. Until then everything stays on the claude/exciting-mendel-isrgzw branch and your main code is unchanged.

> **Going back to the old version at any time:** `git checkout main` in E:\Hinglish Editor DEV. Your original app in E:\remove silence is never affected.
